OPERATOR’S MANUAL

OM673
For Models: M673M, M673D, and M673L
Diesel engine exhaust and some of its constituents are known to the State of California to cause cancer, birth defects, and other reproductive harm.

— CALIFORNIA —
Proposition 65 Warning:
Read this operator's manual thoroughly before starting to operate your equipment. This manual contains information you will need to run and service your new unit.

Introduction

The servicing of marine engines and generator sets presents unique problems. In many cases boats cannot be moved to a repair facility. Marine engines cannot be compared to the servicing of automobiles, trucks or even farm equipment. Failures often occur in remote areas far from competent assistance. Marine engines are taxed far more severely than auto or truck engines; therefore, maintenance schedules must be adhered to more strictly.

Failures begin with minor problems that are overlooked and become amplified when not corrected during routine maintenance.

As operator, it is your obligation to learn about your equipment and its proper maintenance. This is not a comprehensive technical service manual. Nor will it make the reader into an expert mechanic. Its aim is to aid you in maintaining your unit properly.

Unit Identification

MODELS INCLUDED

This manual covers the operating instructions for:

Model Numbers

Model numbers give the unit's application, block model, aspiration, and RPM:

M - Northern Lights marine generator set

673

+ Model number of engine block
Bore Cylinders
67 mm 3

M673M = Northern Lights marine diesel generator set with a 673 engine, TF-276M generator end, and an automatic voltage regulator.

M673L = Northern Lights marine diesel generator set with a 673 engine, TF-276D generator end, and an automatic voltage regulator.

M673D = Northern Lights marine diesel generator set with a 673 engine, TF-276D generator end, and an automatic voltage regulator.

Serial Numbers

Your set has three serial numbers: ① an engine number stamped on the block, ② a generator number, and ③ a generator set number.

Use the serial number on the generator set data plate when ordering parts or in correspondence. The generator set data plate is found on the service side of the generator and resembles the drawing in Figure 1.

Figure 1: Generator set serial number data plate.
A warranty registration certificate is supplied with your set. It entitles the original purchaser of our equipment to a warranty covering material or assembly faults. The extent of coverage is described in the Limited Warranty Statement. We recommend that you study the statement carefully.

**NOTE:** If the warranty is to apply, the servicing instructions outlined in this manual must be followed. If further information is needed, please contact an authorized dealer or the factory.

---

### Safety Rules

**CAUTION:** Accident reports show that careless use of engines causes a high percentage of accidents. You can avoid accidents by observing these safety rules. Study these rules carefully and enforce them on the job.

- Never leave engine without proper security.
- Turn the coolant tank cap slowly to relieve pressure before removing. Add coolant only when the engine is stopped and cool.
- Mount a fire extinguisher near engine.
- Always disconnect the battery ground strap before making adjustments.
- Operate engines in properly ventilated areas.
- Keep trash and other objects away from engine.
- Escaping fluids under pressure can penetrate your skin. Use a piece of cardboard or wood, not your hands, to search for leaks.
- Avoid wearing loose clothing without a belt when working around engines.
- Do not oil or grease engine while it is running.
- Use caution in handling fuel. Never refuel a hot or running engine. Do not smoke while filling fuel tank or servicing fuel system.
- Keep your hands, feet, hair and clothing away from power-driven parts.
- Check for any loose electrical connections or faulty wiring.
- Engines should be operated only by knowledgeable, qualified personnel.
- Look completely around engine to make sure that everything is clear before starting.
- Do not operate an engine that isn't in proper working order. If an unsafe operating condition is noted, tag the set and control panel so others will also know about the problem.
- Provide first aid kits.

---

**CAUTION:** This symbol is used throughout this book to alert you to possible danger areas. Please take special notice of these sections.
Marine Generator Component Locations

Figure 2: M673 Non-Service Side.

Figure 3: M673 Service Side.

1. Heat Exchanger End Cap
2. Coolant Fill
3. Heat Exchanger/Expansion Tank/Exhaust Manifold
4. Lube Oil Fill- Top
5. Wet Exhaust Elbow
6. Generator End Cover
7. Base and Drip Pan
8. Starter Motor
9. DC Regulator
10. Belt Guard
11. DC Alternator
12. DC Circuit Breaker
13. Generator Control Box
14. AC Circuit Breaker
15. Air Filter Housing
16. Fuel Injector
17. Fuel Injection Pump
18. Fuel Lift Pump
19. Lube Oil Drain
20. Sea Water Pump
21. Lube Oil Fill- Side
22. Lube Oil Dipstick
23. Block Drain
24. Lube Oil Filter
25. Secondary Fuel Filter
26. Control Panel Plug-In
27. Fuel Inlet and Return
28. AVR Circuit Breaker
1. **SHUTDOWN BYPASS-PREHEAT SWITCH**
   There are three functions built into this switch: preheating the engine, flashing the generator field, and bypassing the engine safety shutdown circuit enabling a start. Hold the switch in the ON position for approximately 10 to 20 seconds before starting a cold engine. Holding the switch ON for too long can burn out the glow plugs.
   
   **NOTE:** Three position Engine Control switches must be in the RUN position during preheating. Preheat switch must be held in ON position during starting.

2. **ENGINE CONTROL SWITCH**
   To start the engine, hold this switch in the START position until the engine is running.
   
   **NOTE:** Excessive cranking of marine sets equipped with water lift muffler systems can cause engine damage. See page 7.
   
   After the engine starts, release the switch and it will return to RUN position. To stop the engine, hold the switch in the STOP position.
   
   **NOTE:** The rocker switch is used on Series 1 panels only, and has a light that glows when the set is running.

3. **HOUR METER**
   Keeps track of engine running time.

4. **OIL PRESSURE GAUGE**
   Shows the oil pressure in the engine lubricating system.

5. **WATER TEMPERATURE GAUGE**
   Registers the temperature of the cooling water.

6. **D.C. VOLTMETER OR AMMETER**
   When the engine is stopped, the voltmeter indicates the condition of the battery. When the engine is running, the voltmeter indicates the voltage output of the alternator.

   **For Series 4 Control Panels Only:**

7. **A.C. VOLTMETER**
   Shows the generator output voltage.

8. **FREQUENCY METER (Hertz)**
   The frequency meter indicates engine speed: 1200 or 1800 RPM (60 Hz), or 1500 RPM (50 Hz).

9. **AMMETER SELECTOR SWITCH**
   Used to check each phase for load condition.
   
   **NOTE:** Always leave this switch in the ON position while the unit is running.

10. **A.C. AMMETER**
    Shows the generator load on each phase. The phase is selected with the Ammeter Selector switch (Item 9).
1. **SHUTDOWN BYPASS SWITCH**
   
   **Manual Start Panels**
   (S-7.0 and S-7.3)
   
   Hold the switch in the on position for approximately 10 to 20 seconds before starting a cold engine. Holding the switch on for too long can burn out the glow plugs. To start the engine the bypass switch must be held on while moving the engine control switch into the start position. As soon as the engine starts release both switches.
   
   **Auto Start Panels**
   (S-7.2, S-7.4, S-7.5, and S-7.6)
   
   When the switch is in the auto start position, the unit will start upon closure of auxiliary contacts. Moving the switch to the manual position will start the engine and it will run after the control timers have completed their sequence.

2. **OIL PRESSURE GAUGE**
   Shows the oil pressure in the engine lubricating system.

3. **HOUR METER**
   Keeps track of engine running time.

4. **ENGINE TEMPERATURE GAUGE**
   Registers the temperature of the coolant.

5. **D.C. VOLTMETER**
   When the engine is running, the voltmeter indicates the voltage output of the alternator.

6. **STATUS INDICATOR PANEL**
   Engine monitoring alarms and lamps for monitoring engine functions.

7. **ALARM LAMP TEST AND RESET BUTTON**
   Press UP to test the indicator lights and press DOWN to reset the alarm.

8. **A.C. VOLTAGE ADJUSTMENT RHEOSTAT**
   Voltage has been set at the factory and should only be adjusted by factory-trained personnel.

9. **AMMETER SELECTOR SWITCH**
   Used to check each phase for load condition. 
   
   **NOTE:** Always leave this switch in the ON position while the unit is running.

10. **FREQUENCY METER (HERTZ)**
    The frequency meter indicates alternator current frequency: 60 Hz (1200 or 1800 RPM), or 50 Hz (1500 RPM).

11. **A.C. VOLTMETER**
    Shows the generator output voltage.

12. **A.C. AMMETER**
    Shows the generator load on each phase. The phase is selected with the Ammeter Selector switch (Item 9).
BREAK-IN PERIOD

1. The first 100 hours on a new or reconditioned engine are critical to its life and performance.
2. Constantly check the engine temperature and oil pressure gauges (sets with Series 3 or 4 panels).
3. Oil consumption is greater during break-in as piston rings take time to seat.
4. Break-In Oil Changes: Change engine oil and filter at 50 hours. Change oil and filter again at 100 hours (consult Lubricants section for oil recommendation).

Operating Instructions:
Maintain at least a 75% load on your generator set for the first 100 hours. Vary the load will help seat the rings.

BEFORE STARTING

1. Check the water level by removing the pressure cap from the expansion tank or radiator. In order to give the cooling water an opportunity to expand, the level should be about 1 in. (2.5 cm) below the filler cap sealing surface when the engine is cold.

CAUTION: Use protective clothing and open the filler cap carefully when the engine is warm to prevent burns.

2. Check the oil level in the crankcase with the dipstick. The oil level must be in the waffled area on the stick. Never allow the level to go below this area. Always add the same viscosity of oil as is already in the crankcase.
3. Check the fuel tank level and open any fuel valves.
4. Marine Sets: close the sea-cock, check and clean the sea strainer and reopen the sea-cock.
5. Marine Sets: place the battery switch in the ON position.

NOTE: The battery switch must always be kept ON while the engine is running. If the switch is turned OFF while the engine is running, the battery charging regulator could be ruined.

STARTING FOR S-1, S-1B, S-3, AND S-4, SEE PAGE 6 FOR S-7

1. Hold the Shutdown Bypass-Preheat switch in the ON position for 10 to 20 seconds before starting a cold engine. Holding the switch too long can burn out the glow plugs.
2. While holding the Shutdown Bypass-Preheat switch in the ON position, push the Engine Control switch to the START position.
3. As soon as the engine starts, release both switches. Do not crank the starter for more than 20 seconds consecutively. If the engine fails to start with the first attempt, be sure that it has stopped completely before re-engaging.

NOTE: Excessive cranking of the starter on Marine sets equipped with a water lift muffler can cause engine damage. If the engine does not start after three 20-second cranks, remove the impeller from the raw water pump. This will prevent the muffler from filling with water and backfilling the exhaust line and engine. Once the engine starts, shut it off immediately and re-install the impeller. Re-start the engine and check the exhaust overboard outlet for gushes of water.

OPERATING

1. Units with Series 3, Series 4, and Series 7 Control Panels: check gauges often. Oil pressure must be above 15 PSI. The D.C. voltmeter should read between 11 and 15 volts at 80°F (25°C) ambient temperature. The water temperature gauge on Marine sets must be below 200°F (94°C); on Industrial units, the water temperature gauge must be below 225°F (107°C). Check the A.C. voltage and frequency meters (Series 4 and 6 panels). If the gauges deviate from normal levels, shut down the generator set and investigate.
2. Let the unit run unloaded for a 3 - 5 minute warm-up period.
3. Add electrical load.

STOPPING

1. Remove electrical load from the generator set.
2. Run the engine for a 3 to 5 minute cool down period.
3. Move the Engine Control switch to the STOP position momentarily.
4. Marine Sets: shut off the seacock, fuel valve, and battery switch.
SHUTDOWNS AND ALARMS

1. Your unit may be fitted with a warning horn to protect it from high water temperature or low oil pressure.
   a. Generator sets have shutdown systems to stop the engine. They have no warning horns.
   b. Other alarms and shutdowns are available as optional equipment.

   NOTE: Do not rely on your warning to the exclusion of careful gauge monitoring. Watching your gauges can prevent damage to the unit and dangerous power losses.

2. Do the following when your warning or shutdown system is activated:
   a. Check the temperature gauge.
      If above 205°F (96°C), shut off the engine immediately.
   b. Use the Trouble Shooting Guide on page 25 to isolate the cause of the overheat.

   CAUTION: Do not remove the water fill cap of an overheated engine. Escaping high temperature steam can cause severe burns. Allow the engine to cool and then remove the cap slowly using protective clothing.

   c. Make repairs. Restart your Marine set after the temperature gauge registers below 200°F (94°C).
   d. Watch the temperature gauge regularly and turn off the unit if the temperature rises above 205°F (96°C) on Marine units.

3. If shutdown is activated and the temperature gauge shows temperature within normal temperature range:
   a. Check the engine crankcase oil level.
   b. If the oil level is low, fill with recommended lubricating oil and restart. Watch the oil pressure gauge carefully and shut off the engine if it does not show a normal reading (20-60 PSI) after a few seconds of operation.
   c. If the oil level is normal, DO NOT restart the engine. Call your dealer for assistance.

SPARE PARTS

1. ADE recommends that you keep the following spare parts on hand for field service. The parts are available from your local Northern Lights dealer. Some marine models already have “On-Board-Kits,” a handy box that contains the most common parts you will need.

2. All owners should have the following:
   a. Primary and secondary fuel filter elements
   b. Oil filters
   c. Air filter (industrial units only)
   d. Alternator belt
   e. Thermostat and gaskets
   f. Raw water pump impeller & gaskets (marine only)
   g. Glow plug
   h. Injector and washer

3. If your set is operating a long distance from a servicing dealer, add the following:
   a. Complete set of injectors
   b. Copper washers for injector change
   c. Complete set of glow plugs
   d. Fuel lift pump
The Servicing Schedule Chart below shows the service schedule required for proper maintenance of your generator set. More detailed coverage of each Service Point (SP) is listed on the page noted in the ‘page’ column.

**DAILY:**
- SP1: Check oil level in engine
- SP5: Check V-belt tension
- SP7: Check primary fuel filter
- SP13: Check cooling water level
- SP17: Check electrolyte level in batteries
- SP2/3: Change engine oil and filter
- SP6: Adjust valves

**AFTER FIRST 50 HOURS:**
- SP2/3: Change engine oil and filter
- SP6: Adjust valves

**AFTER FIRST 100 HOURS:**
- SP2/3: Change engine oil and filter

**EVERY 250 HOURS:**
- SP2/3: Change engine oil and filter
- SP4: Check air cleaner
- SP10: Bleed the fuel system
- SP18: Check condition of batteries with a hydrometer

**EVERY 500 HOURS:**
- SP8: Change primary fuel filter element
- SP9: Change secondary fuel filter
- SP21: Inspect condition of exhaust elbow

**EVERY 1000 HOURS:**
- SP4: Change air cleaner element
- SP6: Check valve clearances
- SP11: Check injectors
- SP16: Change impeller

**EVERY 2500 HOURS:**
- SP12: Check fuel injection pump
- SP14: Check and flush cooling system
- SP15: Check and clean heat exchanger

1) Perform all maintenance once a year even if hour level has not been reached.
2) Consult manufacturer's maintenance schedule, note on chart.
3) Whenever necessary.
4) More often if necessary.
LUBRICATION - GENERAL

1. Use only clean, high quality lubricants stored in clean containers in a protected area.
2. These lubricants are acceptable:
   a. API Service CC/CD/CE single viscosity oils.
   b. API Service CC/CD/SF multi-viscosity oils.
3. Use the proper weight oil for your average operation temperature.

<table>

</tr>
<tr>
<td>Below -10°F (-23°C)</td>
<td>SAE 5W</td>
<td>SAE 5-20W</td>
</tr>
</tbody>
</table>

Figure 8: Lube Oils

4. Some increase in oil consumption may be expected when SAE 5W and SAE 5-20W oils are used. Check oil level frequently.
5. Never put additives or flushing oil in crankcase.

SP1. CHECKING OIL LEVEL

1. Check the oil level in the crankcase with the dipstick. The oil level must be in the waffled area on the stick. Never allow the level to go below this area. Follow the lubrication recommendations above.

SP2. OIL CHANGES

1. The set is delivered with special break-in oil. Change the engine oil and oil filter after 50 hours of operation. Use Service CC 30 weight oil during the first 100 hours.
2. Change the oil and filter again at 100 hours using the oil recommended in the previous diagram. After this, change oil and filter on marine units every 250 hours.
3. During intermittent cold weather operation, change oil every 100 hours or six weeks, whichever comes first.
4. Change oil at any seasonal change in temperature when a new viscosity of oil is required.
5. Change oil when engine is warm.
6. Dispose of waste oil in an approved manner.
7. Never use a flushing oil.
8. Loosen the clamp on the oil change tube. Remove cap. Drain oil. Replace the cap and tube.
9. Refill engine with recommended oil.
10. Engine capacity with new oil filter is:

<table>
<thead>
<tr>
<th>Engine Type</th>
<th>Oil Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>673M, D, &amp; L</td>
<td>3.2 quarts (3.0 liters)</td>
</tr>
</tbody>
</table>

SP3. CHANGING LUBE OIL FILTER

1. Change the lube oil filter every with every oil change.
2. Use a filter wrench to remove old filter. Dispose of filter in approved manner.
3. Make sure the gasket from the old filter is removed and discarded. Clean mount face.
4. Spread a thin film of engine oil on the rubber gasket on the new filter and screw it on nipple until gasket meets the sealing surface.
5. Using hands only – no wrench – tighten filter one-half turn farther. Overtightening can do damage to filter housing.
6. Fill engine with recommended oil. Start engine and check for leakage. Stop engine, wait 3 minutes, and check oil level. Add additional oil if necessary.
7. Oil filter part numbers are:

<table>
<thead>
<tr>
<th>Filter Type</th>
<th>Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>673M</td>
<td>#24-02001</td>
</tr>
<tr>
<td>673L</td>
<td>#24-08001</td>
</tr>
</tbody>
</table>
**Servicing**

**SP4. AIR CLEANER**

1. Inspect air cleaner every 250 hours. In dusty conditions, check more often.
2. **M673:**
   Inspect the element. If it is dirty, wash the element in soapy water. Rinse and dry thoroughly before re-installing.

   *NOTE: Make absolutely sure no impurities enter the engine while changing the element. Do NOT run the engine with the air cleaner removed.*

**SP5. V-BELTS**

1. Check the tension and wear on the V-belt daily.
2. Use your thumb to press on the belt at the midpoint between the crankshaft and alternator pulleys. The tension is correct if the belt can be depressed about 3/16 in. (5 mm).

**TORQUING CYLINDER HEAD BOLTS**

1. Tighten bolts when the engine is cold.
2. Loosen the nuts and remove rocker arm cover.
3. Remove fuel injectors and related tubes.
4. Tighten head bolts with a torque wrench in the order shown in the figure below. Tighten bolts evenly in 2 or 3 passes, ending at the specified torque in final pass.
   a. Torque: 26 - 29 ft/lbs (3.5 - 4.0 kg/m)
5. Re-install rocker arm shaft and adjust valves.
   Torque nuts to: 7 - 9 ft/lbs (1.0 - 1.3 kg/m)
6. Re-install injectors and tubes and rocker cover.
   Torque injectors to: 43 - 51 ft/lbs (6 - 7 kg/m)
   Use new injector sealing washers.

   *Figure 9: 673M Head Torque Sequence*

**SP6. VALVE CLEARANCES**

1. Re-adjust valve clearance after first 50 hours of operation and every 1000 hours thereafter.
2. Valve adjustments should be done after the cylinder head bolts have been re-tightened. Engine should be cold and NOT running.
3. Watch the valves while turning the engine over by hand. Turn until the #1 cylinder inlet valve starts to open and the exhaust valve starts to close (the valves are rocking). Then turn the crankshaft one more full turn and adjust the clearance on both valves for this cylinder.
4. Loosen the lock nut and adjust the clearance between the rocker arm and valve stem of both the intake and exhaust valves with the adjustment screw (*Figure 10*). Clearance on both intake and exhaust valves should be 0.008 in. (0.2 mm).
5. Repeat steps 3 and 4 for each cylinder. Each set of valves must be adjusted individually.
6. Replace the rocker arm cover. Tighten cover nuts to 7.2 - 8.7 ft/lbs (1.0 - 1.2 kg/m).

   *Figure 10: Valve Adjustment*
**FUELS - GENERAL**

1. Use only clean, high quality fuels of the following specifications, as defined by ASTM designation D975 for diesel fuels:
   a. Use Grade No. 2 diesel at ambient temperatures above freezing 32°F (0°C).
   b. Use Grade No. 1 at ambient temperatures below freezing and for all temperatures at an altitude of above 5,500 ft. (1500 meters).
2. Use fuel having less than 1% sulphur (preferably less than 0.5%).
3. The cetane number should be a minimum of 45.
4. DO NOT use these unsuitable grades of fuel:
   a. Domestic heating oils, all types.
   b. Class B engine.
   c. Class D domestic fuels.
   d. Class E, F, G or H industrial or marine fuels.
   e. ASTM-D975-60T No. 4-D and higher number fuels.
5. Storing fuel:
   a. Keep dirt, scale, water, and other foreign matter out of fuel.
   b. Avoid storing fuel for long periods of time.
   c. Fill the fuel tank at the end of each day’s operation. This will reduce condensation.

**SP7-9. FUEL FILTERS**

1. Your generator set should have a primary fuel filter installed. We recommend the Racor brand of fuel filter-water separators.
   a. Check the primary fuel filter daily as recommended by the filter manufacturer. Empty the collection bowl as necessary.
   b. Change the element as often as necessary or every 250 hours.
   c. If the bowl fills with water, change the primary and secondary element immediately.
2. Change secondary fuel filter every 200 hours.
   a. Remove the spin-on filter by turning it counterclockwise with a filter wrench. Fill the new cartridge with fuel and install it after applying engine oil to gasket surface. Screw on until the gasket surface comes into contact with sealing surface of filter base. Then, tighten it two-thirds of a turn by hand. Do not overtighten.
   b. Fuel filter part numbers are:

   ![Fuel Filter Image](#24-52020)

   Found on all M673M, D, & L units
SP10. BLEEDING THE FUEL SYSTEM

CAUTION: Escaping diesel fuel under pressure can penetrate skin causing serious personal injury. Before disconnecting lines be sure to relieve all pressure. Before applying pressure, be sure all connections are tight and lines, pipes and hoses aren’t damaged. Fuel escaping from a very small hole can be almost invisible. Use a piece of cardboard or wood, rather than hands, to search for suspected leaks. If injured by escaping fuel, see a doctor at once. Serious infection or reaction can develop if proper medical treatment isn’t administered immediately.

1. The fuel system is self-bleeding. However, any system may need manual bleeding when:
   a. A new fuel filter is installed;
   b. The engine has run out of fuel;
   c. The fuel lines, injection pump or any other fuel system component has been removed and installed.

2. Loosen bleed screw “A” (Figure 11) on top of the filter. Pump hand primer “B” on fuel lift pump until pure fuel (no bubbles) escapes from bleed screw “A”. Tighten bleed screw “A”.

3. Loosen bleed screw “C”. Pump hand primer “B” on fuel lift pump until pure fuel (no bubbles) escapes from bleed screw “A”.

4. If the engine does not start after the above bleeding process, loosen a fuel line at the injector. Crank the engine until fuel escapes, then tighten the connection. Do each line **one at a time**.

5. After the engine has started, check for fuel leaks.

Figure 11-A: M673 Fuel System.
SP11. INJECTOR SERVICE

1. Injectors should be checked every 600 hours. Check should be made by a Northern Lights dealer or local injection repair station.

**CAUTION:** Escaping diesel fuel under pressure can have sufficient force to penetrate the skin causing serious personal injury. If injured by escaping diesel fuel, see a doctor at once.

2. Injector removal:
   a. Clean loose dirt from around the injectors and the fuel lines.
   b. Relieve high pressure in the fuel lines by loosening the delivery line flare nuts at each injector (Figure 12).
   c. Remove delivery lines by disconnecting from injectors and injection pump (Figure 13). Remove all lines as an assembly; do not remove the clamp. Cover the ends of the lines, the injector inlets and injection pump outlets to keep dirt out (Figure 14).
   d. Remove the return line retaining bolts (Figure 15). Remove the return line (Figure 16).
   e. Unscrew and remove the injectors (Figure 17). *NOTE: Do not use pry bars to remove injectors from cylinder head.*
   f. After removing the injectors, discard the copper sealing washers from the injector hole in the head (Figure 18). Cover holes to prevent dirt and debris from entering the cylinders.

3. Injector installation:
   a. Install a new copper sealing washer in each injector hole (Figure 18).
   b. Screw in injector and tighten to 43 or 50 ft/lbs (6 to 7 kgm) (Figure 19). *NOTE: Overtightening can damage injector.*
   c. Install return line using new copper sealing below each connection. Tighten return line retaining bolts to 22 - 30 ft/lbs.
   d. Install delivery lines. Leave loose at injectors for bleeding.
   e. Crank the engine to fill lines. Tighten lines at injectors. Start engine and check for leaks using a piece of paper or cardboard. **DO NOT use hand to check for leaks.**

SP12. INJECTION PUMP

1. Since operating conditions may vary considerably, it is difficult to give a definite interval for checking the injection pump. But as a rule, pump settings, maximum speed, idle speed and exhaust smoke should be checked after every 2400 hours of operation. Service of the fuel injection pump should only be done if checks indicate pump malfunction.

2. Black smoke can be an indication of pump malfunction. Before servicing the pump, check other possible causes:
   a. Check cleanliness of air filter.
   b. Check valve clearances.
   c. Clean and check injectors.

3. Any repair which involves disassembly of the injection pump must be carried out by specially trained mechanics with the proper tools and test equipment. *NOTE: All warranties on the engine become null and void if the injection pump seals are broken by unauthorized persons.*

COOLING SYSTEM - GENERAL

*NOTE:* Marine sets – be sure to close the sea-cock before working on the engine cooling system.

**CAUTION:** The cooling water in the engine reaches extremely high temperatures. You must use extreme caution when working on hot engines to avoid burns. Allow the engine to cool before working on the cooling system. Open the filler cap carefully, using protective clothing when the engine is warm.

SP13. CHECK THE COOLANT LEVEL

1. Check the coolant level each day before starting the engine. Check the water level by removing the pressure cap from the expansion tank or radiator. In order to give the cooling water an opportunity to expand, the level should be about 1 in. (2.5 cm) below the filler cap sealing surface when the engine is cold.

2. The pressure valve in the filler cap releases when the pressure is approximately 7 PSI (0.5 bar). Use a cap pressure tester to check cap if you suspect it is faulty.
Servicing

**Figure 12:** Remove delivery line flare nuts.

**Figure 13:** Remove delivery lines.

**Figure 14:** Cover lines, inlets and injection pump outlets.

**Figure 15:** Remove return line nuts.

**Figure 16:** Remove return line.

**Figure 17:** Un screw injector.

**Figure 18:** Remove and replace copper sealing washer.

**Figure 19:** Reinstall injector. Torque to proper tightness.
**SP14. COOLING SYSTEM FLUSHING**

1. Flush the cooling system every 600 hours or every 12 months, whichever comes first.
2. Marine sets:
   a. Remove expansion tank cap and drain engine block.
   b. Leave all drains open.
   c. Pour clean water into expansion tank until water coming from drains is free of discoloration and sediment.
   d. Let water drain completely.
   e. Close drains and refill with recommended mixture.

   *NOTE: Open sea cock before running engine.*

3. Industrial sets:
   a. Remove radiator cap and open drain cocks on radiator and engine block.
   b. Pour clean water into radiator until water coming from radiator is clear of discoloration.
   c. Close the radiator drain and continue flushing until water from engine drain is clear.
   d. Open all drain cocks and drain completely.
   e. Close drain cock and refill with recommended coolant mixture.
   f. Clean fins on radiator.
4. Coolant Specifications (marine and industrial):
   Use 50% water / 50% ethylene glycol antifreeze mix. Antifreeze mixture is recommended as a good year-round coolant.
5. Check hoses and connections and repair any leakage.

**SP15. HEAT EXCHANGER**

1. Clean the heat exchanger core once a year or after 2400 hours of operation.
2. Drain expansion tank and heat exchanger.
3. Remove heat exchanger end covers and remove core.
4. Clean the inside of exchanger core tubes using a metal rod. Flush, inspect and clean again if necessary.
5. Reassemble. Fill the cooling system, start the engine and check for leaks.

**SP16. RAW WATER PUMP**

1. Change the seawater pump impeller every 1000 hours, or as needed.
2. Remove the pump end cover. Pry out the impeller using needle-nose pliers or two screwdrivers. Be sure you remove all pieces of failed impeller.

   *NOTE: Place some kind of protection under the screwdrivers in order not to damage the pump housing.*

3. Clean the inside of the housing.
4. Press in the new impeller and place the sealing washers in the outer end of the impeller center if this has not already been done.
5. Replace the cover using a new gasket or o-ring.

   *NOTE: Make sure that there is always an extra impeller and cover gasket in reserve on board.*

**GENERATOR ENDS**

The maintenance and operation recommendations for the generator end are located on pages 19-22 under the heading “AC Generator”.

**ELECTRICAL SYSTEM - GENERAL**

1. Never switch battery switch off or break the circuit between the alternator and batteries while the engine is running. Regulator damage can result.
2. Do NOT reverse the polarity of battery cables when installing the battery.
3. When welding on the unit, disconnect the AC and DC voltage regulator and battery. Isolate the leads.
4. Disconnect the battery cables when servicing the D.C. alternator.
5. Never test with a screwdriver, etc., against any terminal to see if it emits sparks.
6. Do not polarize the alternator or regulator.
7. A D.C. circuit breaker protects your control panel and wiring harness. It is located in the side of the generator junction box.
GLOW PLUGS

1. Each cylinder is supplied with a glow plug which serves to heat the combustion chamber for starting.
2. To check the glow plugs, loosen the current carrying flat wire between the plus-poles of the glow plugs (Figure 20). Connect a D.C. test bulb between the plus-pole of the battery and the plus-pole of the glow plug. If the bulb lights up, the glow plug is functioning properly.
3. Check all glow plugs and replace any faulty ones.

![Glow Plugs](image)

Figure 20: Glow plugs.

BOOSTER BATTERIES

**CAUTION:** Battery gas can explode. Keep all flames and sparks away from batteries.

1. Before changing or using booster batteries, check battery electrolyte level. Add distilled water if necessary.
2. Booster and main batteries must have the same voltage rating.
3. First, connect positive (+) terminal of booster battery to positive (+) terminal of main battery. Then, connect negative (-) terminal of booster battery to ground on the engine block (see Figure 21).
4. Remove booster battery after starting engine.
5. Sealed batteries: See manufacturer charging and booster instructions.

![Battery connections](image)

Figure 21: Battery connections.

SP 17-18. BATTERY CARE

1. Check electrolyte level every 50 hours or once per month. Add distilled water to manufacturer’s recommended level.
2. Batteries, cables and cable terminals should be checked and cleaned every 100 hours. Clean corrosion with a water and baking soda solution. Flush with clean water. Tighten terminals and grease them to inhibit corrosion.
3. Check the battery condition with a hydrometer every 600 hours.

SP19. WINTERIZING / OUT-OF-SERVICE

1. Drain fresh water and seawater cooling systems completely. Remember to shut off seacocks before opening drain cocks if the vessel is in the water.
2. Drain water supply lines and wet exhaust line.
3. Loosen the seawater pump cover and drain pump.
4. Change the crankcase oil and filter.
5. Loosen the alternator belt.
6. Disconnect and clean battery. Remove to warm storage place if possible.
7. Clean outside of unit. Paint any scratched or chipped surfaces. Put corrosion preventative on all exposed metal surfaces.
8. Fill the fuel tank or add biocide as per manufacturer’s instructions.
GENERAL
1. A Generator Set includes the engine, the generator, and the control or “J” box (Figure 22).
2. The generator and the control or “J” box produce the electrical power.
3. Generator excitation is provided by activation of the pre-heat circuit and electrical output voltage is controlled by the automatic voltage regulator (AVR) located in the control box (Figure 24, Item 2).

10. Field Core
11. Shaft
12. Ventilation Cover

CONTROL BOX (Figure 24)
1. Control Terminal Board
2. Automatic Voltage Regulator (AVR)
3. 12 Volt DC Circuit Breaker
4. AC Circuit Breaker
5. AVR Circuit Breaker
6. Output Terminal Board
CONNECTIONS

1. 120 Volt Output:
   a. 120 volt output can be selected by connecting the terminals of the control terminal board to 120 (Figure 25).

   ![Figure 25: Control Terminal Board, 120 Volt Output](image)

   b. Connect U1 to U2 and V1 to V2 on the output terminal board (Figure 26). Connect 120 volt output leads to terminals U1 and V2.

   ![Figure 26: Output Terminal Board, 120 Volt Output](image)

2. 240 Volt Output:
   a. 240 volt output can be selected by connecting the terminals of the control terminal board to 240 (Figure 27).

   ![Figure 27: Control Terminal Board, 240 Volt Output](image)

   b. Connect U2 to V1 on the output terminal board (Figure 28).

   ![Figure 28: Output Terminal Board, 240 Volt Output](image)

3. 120/240 Volt Output
   a. Connect the control terminal board for 240 volts (Figure 29).

   ![Figure 29: Control Terminal Board, 120/240 Volt Output](image)

   b. Connect U2 and V1 on the output board (Figure 30). Connect output leads to U1 and V2 and neutral lead to V1 (or U2). 240 volt output is available from the leads connected to U1 and V2. The 120 volt load should be divided as equally as possible between two 120 volt circuits.

   ![Figure 30: Output Terminal Board, 120/240 Volt Output](image)
OPERATION

In order to ensure a long, trouble-free life, the generator must be operated properly and the specified maintenance must be performed.

OPERATING ENVIRONMENT

Always keep electrical equipment clean. Moisture, salt, dust, and oil will damage the generator. The operating environment must be kept as clean and moisture free as possible.

VENTILATION

Good ventilation is important for proper generator operation. When installing the generator set, be sure the ambient temperature does not exceed 40°C (104°F) during operation.

MAINTENANCE

Proper and effective maintenance is required to ensure trouble-free operation. In addition to the above items, the following are required:

1. Periodically check all bolts and nuts for proper torque. This is especially true for coupling bolts.

2. Be sure to keep the generator area clean and dry.
   a. Dust and foreign material may reduce the flow of cooling air, reducing heat dissipation and causing the generator to overheat.
   b. If electrically conductive debris accumulates on the windings, or if moisture or salt water are absorbed into the windings, the windings may short or ground, reducing voltage output.
   c. Wiping is the only effective method for removing dust and foreign materials. Use a clean, lint-free piece of cloth.

3. If the generator has not been operated for an extended period of time, check the insulation resistance of each stator coil and the rotor. Disconnect the AVR from the generator when performing this test.

4. Voltage Adjustment
   a. If there is some voltage, but it does not build up to rated voltage, voltage adjustment can be made using the “hand trimmer” in the AVR (Figure 31).
   b. The normal voltage setting at no load is 121 volts at 62 Hertz or 242 volts at 62 Hertz.

Figure 31: Hand Trimmer Location on AVR.

5. Check the ball bearing in the generator end.
   a. Listen for unusual noise.
   b. Abnormal temperature rise can be noted by discoloration.
   c. If the bearing is failing, it must be replaced.
   d. Generator bearing should be replaced by your Northern Lights dealer at 10,000 hours.

6. Check the brushes
   a. The carbon brushes gradually wear with use, so they must be inspected periodically and replaced as necessary.
   b. If the brushes are excessively worn as to expose the pigtail (Figure 32), sparking will occur at the surface of the slip ring, causing surface damage. Therefore, periodic inspection of the brushes is important.
   c. Normally, the brushes will have to be replaced with a new brush assembly within 3,000 hours.

Figure 32: Brush Pigtail.
7. Replacing Brushes  
   a. Shut down the generator. Remove four screws and end cover of the generator.  
   b. Brush assembly is white plastic with two wires leading to it. It is located at ten o’clock and is held in position by two screws (Figure 33). Remove the screws and unplug leads.  

   Figure 33: Brush Location.  

   c. Attach leads to new brush assembly and install it with the plastic ears towards the front of the generator.  

   NOTE: Be sure to connect wire J to terminal J, and connect wire K to terminal K.  

8. Generator Protection  
   To protect the generator and AVR from unbalanced loads and over loads, two 20 amp breakers are placed in the output circuit and one 3 amp breaker is placed in the AVR sensing circuit (Figure 34).  

   Figure 34: Breaker Locations.  

9. Parts: See Parts Book for complete list  
   a. Bearing  
      Part #22-68305
