OPERATOR'S MANUAL

for Northern Lights® M984K Diesel Generator Sets

Read this operator's manual thoroughly before starting to operate your equipment. This manual contains information you will need to run and service your new unit.

1
Introduction

The servicing of marine engines and generator sets presents unique problems. In many cases, boats cannot be moved to a repair facility. Marine engines cannot be compared to the servicing of automobiles, trucks, or even farm equipment. Failures often occur in remote areas far from competent assistance. Marine engines are taxed far more severely than auto or truck engines; therefore, maintenance schedules must be adhered to more strictly. Failures begin with minor problems that are overlooked and become amplified when not corrected during routine maintenance.

As operator, it is your obligation to learn about your equipment and its proper maintenance. This is not a comprehensive technical service manual. Nor will it make the reader into an expert mechanic. Its aim is to aid you in maintaining your unit properly.

Unit Identification

MODELS INCLUDED

This manual covers the operating instructions for:

M984k marine generator sets, which use the 984 engine block.

Model Numbers

Model numbers give the unit's application, block model, aspiration, and RPM:

\[
\begin{array}{c}
\text{M} - \text{Northern Lights marine generator set} \\
\text{L} - \text{Lugger propulsion engine} \\
\end{array}
\]

\[
\begin{array}{c}
\text{Model number of engine block} \\
\text{Bore} \quad \text{Cylinders} \\
\text{98 mm} \quad 4 \\
\end{array}
\]

\[\text{M984k} = \text{Northern Lights marine diesel generator set with a 984 engine and a PX-300K series generator end.}\]

Serial Numbers

Your set has three serial numbers: ① an engine number stamped on a plate attached to the valve cover, ② a generator end serial number, and ③ a generator set serial number.

NOTE: Always use the generator set serial number when ordering parts or in correspondence. The generator set serial number plate is found on the service side of the generator and resembles the drawing in Figure 1.

Figure 1: Generator set serial number plate.
A warranty registration certificate is supplied with your set. It entitles the original purchaser of our equipment to a warranty covering material or assembly faults. The extent of coverage is described in the Limited Warranty Statement. We recommend that you study the statement carefully.

NOTE: If the warranty is to apply, the servicing instructions outlined in this manual must be followed. If further information is needed, please contact an authorized dealer or the factory.

CAUTION: Accident reports show that careless use of engines causes a high percentage of accidents. You can avoid accidents by observing these safety rules. Study these rules carefully and enforce them on the job.

- Never leave engine without proper security.
- Turn the coolant tank cap slowly to relieve pressure before removing. Add coolant only when the engine is stopped and cool.
- Mount a fire extinguisher near engine.
- Always disconnect the battery ground strap before making adjustments.
- Operate engines in properly ventilated areas.
- Keep trash and other objects away from engine.
- Escaping fluids under pressure can penetrate your skin. Use a piece of cardboard or wood, not your hands, to search for leaks.
- Avoid wearing loose clothing without a belt when working around engines.
- Do not oil or grease engine while it is running.
- Use caution in handling fuel. Never refuel a hot or running engine. Do not smoke while filling fuel tank or servicing fuel system.
- Keep your hands, feet, hair and clothing away from power-driven parts.
- Check for any loose electrical connections or faulty wiring.
- Engines should be operated only by knowledgeable, qualified personnel.
- Look completely around engine to make sure that everything is clear before starting.
- Do not operate an engine that isn't in proper working order. If an unsafe operating condition is noted, tag the set and control panel so others will also know about the problem.
- Provide first aid kits.

CAUTION: This symbol is used throughout this book to alert you to possible danger areas. Please take special notice of these sections.

1. **SHUTDOWN BYPASS**
   This switch bypasses the safety shutdown feature during the starting process.

   **NOTE:** Three position Engine Control switches must be in the RUN position during preheating. Shutdown Bypass switch must be held in ON position during starting.

2. **ENGINE CONTROL SWITCH**
   To start the engine, hold this switch in the START position until the engine is running. After the engine starts, release the switch and it will return to RUN position. To stop the engine, hold the switch in the STOP position.

   **NOTE:** The rocker switch is used on Series 1 panels only, and has a light that glows when the set is running.

3. **HOUR METER**
   Keeps track of engine running time.

4. **OIL PRESSURE GAUGE**
   Shows the oil pressure in the engine lubricating system.

5. **WATER TEMPERATURE GAUGE**
   Registers the temperature of the cooling water.

6. **D.C. VOLTMETER**
   When the engine is stopped, the voltmeter indicates the condition of the battery. When the engine is running, the voltmeter indicates the voltage output of the alternator.

For Series 4 Control Panels only:

7. **A.C. VOLTMETER**
   Shows the generator output voltage.

8. **FREQUENCY METER (Hertz)**
   The frequency meter indicates alternating current frequency: 60 Hz (1800 rpm) or 50 Hz (1500 rpm).

9. **AMMETER/VOLTMETER SELECTOR**
   Used to check the voltage and current of each phase. Return to “Amps Off” position when not monitoring.

10. **A.C. AMMETER**
    Shows the generator load on each phase. The phase is selected with the Ammeter Selector switch (#9).
BREAK-IN PERIOD

1. The first 100 hours on a new or reconditioned engine are critical to its life and performance.

2. Constantly check the engine temperature and oil pressure gauges.

3. Oil consumption is greater during break-in as piston rings take time to seat.

4. Break-In Oil Changes: Change engine oil and filter at 50 hours. Change oil and filter again at 100 hours (consult Lubricants section for oil recommendation).

Operating Instructions:
Maintain at least a 75% load on your generator set for the first 100 hours. If this is not possible, maintain no less than a 50% load to ensure proper seating of the piston rings. Vary the load to help seat the rings.

BEFORE STARTING

1. Check the water level by removing the pressure cap from the expansion tank. In order to give the cooling water an opportunity to expand, the level should be about 1 in. (2.5 cm) below the filler cap sealing surface when the engine is cold.

⚠️ CAUTION: Use protective clothing and open the filler cap carefully when the engine is warm to prevent burns.

2. Check the oil level in the crankcase with the dipstick. The oil level must be between high and low marks on the stick. Never allow the level to go below this area. Always add the same viscosity of oil as is already in the crankcase.

3. Check the fuel tank level and open any fuel valves on the tank and at the secondary fuel filter.

4. Close the sea-cock, check and clean the sea strainer, and reopen the sea-cock.

5. Marine Sets: place the battery switch in the ON position.

NOTE: The battery switch must always be kept ON while the engine is running. If the switch is turned OFF while the engine is running, the battery charging alternator could be damaged.
Operating Procedures

STARTING

1. Hold the Shutdown Bypass switch in the ON position.

2. While holding the Shutdown Bypass switch in the ON position, push the Engine Control switch to the START position.

3. As soon as the engine starts, release both switches. Do not crank the starter for more than 20 seconds consecutively. If the engine fails to start with the first attempt, be sure that it has stopped completely before re-engaging the starter.

NOTE: Excessive cranking of the starter on marine sets equipped with a water lift muffler can cause engine damage. If the engine does not start after 3 consecutive 20-second cranks, remove the impeller from the seawater pump. This will prevent the muffler from filling with water and backfilling the exhaust line and engine. Once the engine starts, shut if off immediately and reinstall the impeller. Restart and check the exhaust overboard outlet for gushes of water.

OPERATING

1. Units with Series 3 and Series 4 Control Panels: check gauges often. Oil pressure must be above 15 PSI. The D.C. voltmeter should read between 11 and 15 volts at 80°F (25°C) ambient temperature. The water temperature gauge must be below 200°F (94°C). Check the A.C. voltage and frequency meters (Series 4 panel). If the gauges deviate from normal levels, shut down the generator set and investigate.

2. Let the unit run unloaded for a three to five minute warm-up period.

3. Add electrical load.

STOPPING

1. Remove electrical load from the generator set.

2. Run the engine for a three to five minute cool-down period.

3. Move the Engine Control switch to the STOP position until the engine stops completely.

4. Shut off seacock, fuel valve, and battery switch.
SHUTDOWN AND ALARMS

1. Your unit is fitted with a system to protect it from high water temperature or low oil pressure.
   a. Generator sets have shutdown systems to stop the engine. They have no warning horns.
   b. Other alarms and shutdowns are available as optional equipment.

   NOTE: If your unit is equipped with optional shutdowns and alarms, do not rely on your warning or shutdown system to the exclusion of careful gauge monitoring. Watching your gauges can prevent damage to the unit and dangerous power losses.

2. Do the following when your warning or shutdown system is activated:
   a. Check the temperature gauge. If above 205°F (96°C), shut off the engine immediately.
   b. Use the Trouble Shooting Guide on page 16 to isolate the cause of the overheat.

   CAUTION: Do not remove the water fill cap of an overheated engine. Escaping high temperature steam can cause severe burns. Allow the engine to cool and then remove the cap slowly using protective clothing.

   c. Make repairs and restart after the temperature gauge registers below 200°F (94°C).
   d. Watch the temperature gauge regularly and turn off the unit if the temperature rises above 205°F (96°C). Repeat troubleshooting.

3. If shutdown is activated and the temperature gauge shows temperature within normal temperature range:
   a. Check the engine crankcase oil level.
   b. If the oil level is low, fill with recommended lubricating oil and restart. Watch the oil pressure gauge carefully and shut off the engine if it does not show a normal reading (20-60 PSI) after a few seconds of operation.
   c. If the oil level is normal, DO NOT restart the engine. Call your dealer for assistance.

SPARE PARTS

1. ADE recommends that you keep the following spare parts on hand for field service. The parts are available from your local Northern Lights dealer. Some marine models may already have “On-Board Kits,” a handy box that contains the most common parts you will need.

   a. Primary and secondary fuel filter elements
   b. Oil filters
   c. Air filter elements
   d. Alternator belt
   e. Thermostat and gaskets
   f. Seawater pump impeller and gaskets
   g. Glow plugs
   h. Injector and washer

2. If your set is operating a long distance from a servicing dealer, add the following:

   a. Complete set of injectors
   b. Copper washers for injector change
   c. Complete set of glow plugs
   d. Fuel lift pump
The Servicing Schedule Chart below shows the service schedule required for proper maintenance of your generator set. More detailed coverage of each Service Point (SP) is listed on the page noted in the ‘page’ column.

### DAILY:
- **SP1**: Check oil level in engine
- **SP8**: Check primary fuel filter
- **SP14**: Check cooling water level
  - Check sea strainer

### AFTER FIRST 50 HOURS:
- **SP2/3**: Change engine oil and filter
- **SP5**: Check V-belt tension
- **SP7**: Adjust valves
- **SP19**: Check electrolyte level in batteries
  - Retighten head bolts

### EVERY 50 HOURS:
- **SP5**: Check V-belt tension
- **SP19**: Check electrolyte level in batteries

### EVERY 100 HOURS:
- **SP2/3**: Change engine oil and filter
- **SP4**: Check air cleaner

### EVERY 200 HOURS:
- **SP9**: Change primary fuel filter element
- **SP10**: Change secondary fuel filter
- **SP18**: Check zinc electrodes

### EVERY 500 HOURS:
- **SP6**: Check valve clearances
- **SP12**: Check injectors
- **SP15**: Check and flush cooling system
- **SP17**: Change impeller
- **SP20**: Check state of charge of batteries

### EVERY 2400 HOURS:
- **SP13**: Check fuel injection pump
- **SP16**: Check and clean heat exchanger
- **SP22**: Check and clean oil cooler in reverse gear

---

Service Notes:
LUBRICATION - GENERAL

1. Use only clean, high quality lubricants stored in clean containers in a protected area.

2. These lubricants are acceptable:
   a. API Service CC/CD/CE single viscosity oils.
   b. API Service CC/CD/SF multi-viscosity oils.

3. Use the proper weight oil for your average operation temperature.

<table>

</tr>
</tbody>
</table>

*Figure 5: Lube Oils*

4. Never put additives or flushing oil in crankcase.

SP1. CHECKING OIL LEVEL

1. While the engine is stopped, check the oil level in the crankcase with the dipstick daily. The oil level must be between the high and low marks on the stick. Fill with the recommended oil, and fill only to the high mark on the dipstick. Follow the lubrication recommendations in Figure 5.

SP2. OIL CHANGES

1. The set is delivered with special break-in oil. Change the engine oil and oil filter after 50 hours of operation. Use Service CC 30 weight oil during the first 100 hours.

2. Change the oil and filter again at 100 hours using the oil recommended in the above diagram. After this, change oil and filter every 100 hours.

3. During intermittent cold weather operation, change oil every 100 hours or six weeks, whichever comes first.

4. Change oil at any seasonal change in temperature when a new viscosity of oil is required.

5. Change oil when engine is warm but not hot.

6. Dispose of waste oil in an approved manner.

7. Never use a flushing oil.

9. Refill engine with recommended oil.

10. Engine capacity with new oil filter is:
    Model 984K ................................ 2.4 gallons (9.0 liters)
**SP3. CHANGING LUBE OIL FILTER**

1. Change the lube oil filter every 100 hours.

2. Use a filter wrench to remove old filter. Dispose of filter in approved manner.

3. Make sure the gasket from the old filter is removed and discarded. Clean mount face.

4. Spread a thin film of engine oil on the rubber gasket on the new filter and screw it on nipple until gasket meets the sealing surface.

5. Using hands only – no wrench – tighten filter one-half turn farther. Over tightening can do damage to filter housing.

6. Fill engine with recommended oil. Start engine and check for leakage. Stop engine, wait 3 minutes, and check oil level. Add additional oil if necessary.

7. Oil filter part number is:
   Model 984K ................................................. #24-05401.

**SP4. AIR CLEANER**

1. Visually inspect air cleaner every 100 hours. In dusty conditions, check more often.

2. Remove the plate on the bottom of the air intake manifold. Remove and inspect the foam element. If dirty, wash element in soapy water. Rinse and dry thoroughly before reinstalling.

   **NOTE:** Make absolutely sure no impurities enter the engine while changing the element, and do not run the engine with the air cleaner removed.

   Do not clean the filter with diesel fuel, solvent, or gasoline. Serious engine damage can result.

**SP5. V-BELTS**

1. Check the tension and wear on the V-belt after every 50 hours.

2. Use your thumb to press on the belt at the midpoint between the crankshaft and alternator pulleys. The tension is correct if the belt can be depressed about 3/8 in. (10 - 15 mm) with 22 lbs. (10 kg) force.

**SP6. RETIGHTENING CYLINDER HEAD BOLTS**

1. Retighten the head bolts after the first 50 hours.

2. Tighten bolts when the engine is cold.

3. Loosen the nuts and remove rocker arm cover and rocker arm shaft.

4. Tighten head bolts with a torque wrench in the order shown in Figure 6. Tighten bolts evenly in 2 or 3 passes, ending at the specified torque in final pass.

   Model 984K .......... 79.0 - 87.0 ft/lbs (11.0 - 12.0 k/gm)

**Figure 6: 4-Cylinder Head Torque Sequence**

5. Reinstall rocker arm shaft and adjust valves.

6. Replace rocker arm cover.
SP7. VALVE CLEARANCES

1. Readjust valve clearance after first 50 hours of operation. Adjust valves every 600 hours thereafter.

2. Warm up the engine to 167°F - 185°F (75°C - 85°C). Shut off fuel and battery.

3. Rotate the crankshaft in a clockwise direction to set cylinder No. 1 to the top dead center. Top dead center (TDC) is when notch “TDC” on the pulley aligns with the pointer and the two valves on cylinder No. 4 “rock”. Rocking is when the rocker arms (for the two valves on a given cylinder) are moving in opposite directions, one up closing the valve and one down opening the other valve. The moment when the two rocker arms are exactly aligned with each other is when they “rock”.

4. Measure the valve clearance for each of the valves (shown as ○ in Figure 8).

   Standard valve clearances for a hot engine are:
   Intake (IN) ........... 0.006 - 0.009 in. (0.15 - 0.25 mm)
   Exhaust (EX) ........ 0.013 - 0.016 in. (0.31 - 0.41 mm)

5. To adjust valve clearance, loosen the lock nut on the adjustment screw. Insert a feeler gauge between the rocker arm and the valve stem cap. Adjust until the feeler gauge slides with a slight drag. Tighten the lock nut and recheck the clearance (Figure 9).

6. Rotate the crankshaft in clockwise direction one full turn to set cylinder No. 4 to top dead center (TDC). Adjust the remaining valves (shown as ○ in Figure 8).

7. Replace the rocker arm cover.

---

Figure 7: Timing Marks

Figure 8: Valve Sequence

Figure 9: Valve Adjustment
FUELS - GENERAL

1. Use only clean, high quality fuels of the following specifications, as defined by ASTM designation D975 for diesel fuels:
   a. Use grade No. 2 diesel at ambient temperatures above freezing 32° F (0°C).
   b. Use grade No. 1 at ambient temperatures below freezing.
   c. International fuel specifications:
      ISO-8217-DMA
      BS 2869 Part 1 Class A1
      BS 2869 Part 2 Class A2

2. Use fuel having less that 1% sulphur (preferably less than 0.5%).

3. The cetane number should be a minimum of 45.

4. DO NOT use these unsuitable grades of fuel:
   a. Domestic heating oils, all types.
   b. Class B engine.
   c. Class D domestic fuels.
   d. Class E, F, G or H industrial or marine fuels.
   e. ASTM-D975-60T No. 4-D and higher number fuels.

5. Storing fuel:
   a. Keep dirt, scale, water, and other foreign matter out of fuel.
   b. Avoid storing fuel for long periods of time.
   c. Fill the fuel tank at the end of each day’s operation. This will reduce condensation.

SP8-10. FUEL FILTERS

1. Your generator set should have a primary fuel filter installed. We recommend the Northern Lights brand of fuel filter-water separators.
   a. Check the primary fuel filter daily as recommended by the filter manufacturer.
   b. Change the element as often as necessary or every 200 hours.
   c. If the bowl fills with water, change the primary and secondary element immediately.

2. Change secondary fuel filter every 200 hours.

NOTE: The fuel filter on the engine is considered the “secondary fuel filter”.

   a. Remove the spin-on filter by turning it counterclockwise with a filter wrench. Fill the new cartridge with fuel and install it after applying engine oil to the gasket surface. Screw on the filter until the gasket surface comes into contact with the sealing surface of the filter base. Then, tighten it two-thirds of a turn by hand. Do not overtighten.
   b. Fuel filter part number is:
      Model 984K ............................................. #24-52020
SP11. BLEEDING THE FUEL SYSTEM

CAUTION: Escaping diesel fuel under pressure can penetrate skin causing serious personal injury. Before disconnecting lines be sure to relieve all pressure. Before applying pressure, be sure all connections are tight and lines, pipes and hoses aren't damaged. Fuel escaping from a very small hole can be almost invisible. Use a piece of cardboard or wood, rather than hands, to search for suspected leaks. If injured by escaping fuel, see a doctor at once. Serious infection or reaction can develop if proper medical treatment isn't administered immediately.

1. The fuel system is self-bleeding. However, any system may need manual bleeding when:
   a. A new fuel filter is installed;
   b. The engine has run out of fuel;
   c. The fuel lines, injection pump or any other fuel system component has been removed and installed.

2. Loosen bleed nipple (Figure 11-A) on top of the fuel filter. Pump hand primer (Figure 11-B) on fuel lift pump until pure fuel (no bubbles) escapes from the bleed nipple (Figure 11-A). Tighten bleed nipple.

3. If the engine does not start after this bleeding process, loosen a fuel line at the injector (Figure 11-C) while cranking the engine with the starter motor until pure fuel escapes. Then tighten the connection. Do each line one-at-a-time.

4. After the engine has started, use a piece of cardboard to look for fuel leaks.

Figure 11: Fuel System
SP12. INJECTOR SERVICE

1. Injectors should be checked every 600 hours. This check should be made by a Northern Lights dealer or local injection repair station.

CAUTION: Escaping diesel fuel under pressure can have sufficient force to penetrate the skin causing serious personal injury. If injured by escaping fuel, see a doctor at once.

2. Injector removal:
   a. Clean loose dirt from around the injectors and the fuel lines.
   b. Relieve high pressure in the fuel lines by loosening the delivery line flare nuts at each injector (Figure 13-C).
   c. Remove delivery lines (Figure 13-C) by disconnecting from injectors and injection pump. Remove all lines as an assembly; do not remove the spacers. Cover the ends of the lines, the injector inlets and injection pump outlets to keep dirt out.

NOTE: On some models it is necessary to remove the air filter housing to access the fuel injection lines.

d. Remove the return line retaining bolts (Figure 13-G), washers, and return line.
e. Loosen the injector retaining nuts equally (Figure 13-G), a little at a time. Remove the injector.
f. Remove the injector seat (Figure 13-G). Cover the holes to prevent debris from entering the cylinders.

NOTE: Do not use pry bars to remove injectors from the cylinder head.

3. Injector repair and cleaning
   a. Take injectors to your Northern Lights dealer or local injection repair station for testing and service.

4. Injector installation:
   a. Install new injector seal washer seat and injector. Evenly tighten the injector retaining nuts (Figure 12-7) to 162 - 243 ft/lbs.
   b. Reinstall the return line (Figure 12-2) using new sealing washers (Figures 12-9 and 12-10). Tighten bolts (Figure 12-8) to 8.7 - 9.4 ft/lbs (1.2 - 1.33 k/gm).

NOTE: Overtightening can damage injectors.

c. Reinstall injection lines (Figure 13-B). Tighten flare nuts (Figure 13-L) at injection pump to 18.2 - 25.3 ft/lbs (2.5 - 3.5 k/gm). Leave the lines loose at injectors for bleeding.
d. Bleed the injection lines (Figure 13-B). Crank the engine to fill the lines. Tighten flare nuts at injectors to 18.2 - 25.3 ft/lbs (2.5 - 3.5 k/gm).
e. Start the engine and check for leaks using a piece of paper or cardboard. Do not use your hand to check for leaks.
Servicing

SP13. INJECTION PUMP

1. Since operating conditions may vary considerably, it is difficult to give a definite interval for checking the injection pump. But as a rule, pump settings, maximum speed, idle speed and exhaust smoke should be checked after every 2400 hours of operation. Service of the fuel injection pump should only be done if checks indicate pump malfunction.

2. Black smoke can be an indication of pump malfunction. Before servicing the pump, check other possible causes:
   a. Check cleanliness of the air filter.
   b. Check valve clearances.
   c. Clean and check injectors.

3. Any repair which involves disassembly of the injection pump must be carried out by specially trained mechanics with the proper tools and test equipment.

NOTE: All warranties on the engine become null and void if the injection pump seals are broken by unauthorized persons.

Figure 13: Fuel System

A. Injection Line Clamps  D. Pump Support Bracket  G. Injector
B. Fuel Injection Lines  E. Timing Mark Plug  H. Throttle Lever
C. Fuel Feed Line  F. Fuel Return Line  I. Hand Priming Pump
J. Air Vent Point  K. (4) Mounting Nuts
4. Injection Pump Removal:

**CAUTION: Escaping diesel fuel under pressure can have sufficient force to penetrate the skin, causing serious personal injury. If injured by escaping diesel fuel, see a doctor at once.**

- a. Clean the injection pump, hoses, and area around the pump with a cleaning solvent or steam cleaner.

**NOTE: Never steam clean or pour cold water on an injection pump while the engine is running or the pump is warm.**

- b. Remove the injection lines (Figure 13-B) from the pump and injectors. Remove all lines as an assembly. Do not remove the spacers. Cover the ends of the lines, the injector inlets, and the injection pump outlets to keep dirt out of the injectors, lines, and pump.
- c. Remove the pump support bracket (Figure 13-D) on rear of pump.
- d. Remove the plug (Figure 13-E) from the timing case cover. Use an indelible marker to put a mark on the injection pump gear through the plug hole. You will use this mark to align the pump during reassembly. Do not rotate the crankshaft after marking.
- e. Remove the 4 mounting nuts (Figure 13-K). Two (2) are found on the back side of the injection pump, and two (2) are found on the front side.
- f. Take the pump to your Northern Lights dealer or an injection repair station for testing and service.

5. Injection Pump Installation:
- a. Reverse the removal process.
- b. Make sure the mark on the gear shows through the plug hole.
- c. Torque mounting bolts to 21.7 - 32.5 ft/lbs (3.0 - 4.5 k/gm).

**INJECTION PUMP TIMING**

1. The injection pump is timed at the factory and the pump body and mounting flange are marked. If pump timing is questionable, follow the procedure below.

2. Check Injection Pump Timing:
   - a. Bleed air from the fuel system (see page 16).
   - b. Remove the fuel injection line from the No. 1 fuel delivery valve on the injection pump (Figure 14).

![Figure 14: Fuel Injection Lines](image)

   c. Pressurize the system with the hand primer pump (Figure 13-I).
   d. Slowly rotate the crankshaft by hand in clockwise direction until fuel just begins to rise in the No. 1 delivery valve.
   e. The crankshaft pulley notch mark for 14° Before Top Dead Center (BTDC) should now align with the timing pointer (Figure 15). If it does not, the injection pump needs to be timed.

![Figure 15: Timing Marks](image)
COOLING SYSTEM - GENERAL

NOTE: Be sure to close the sea-cock before working on the engine cooling system.

⚠️ CAUTION: The cooling water in the engine reaches extremely high temperatures. You must use extreme caution when working on hot engines to avoid burns. Allow the engine to cool before working on the cooling system. Open the filler cap carefully, using protective clothing when the engine is warm.

SP14. CHECK THE COOLANT LEVEL

1. Check the coolant level each day before starting the engine.
   a. Check the water level by removing the pressure cap from the radiator. In order to give the cooling water an opportunity to expand, the level should be about 1 in. (2.5 cm) below the filler cap sealing surface when the engine is cold.
   b. The pressure valve in the filler cap releases when the pressure is approximately 7 PSI (0.5 kg/cm²). Use a cap pressure tester to check cap if you suspect it is faulty.

SP15. COOLING SYSTEM FLUSHING

1. Flush the cooling system every 600 hours or every 12 months, whichever comes first.

2. Remove fill cap and open drains on engine block. The hex-headed engine block drain is on the service side of the engine below the intake manifold, next to the flywheel housing.

3. Pour clean water into the engine until water coming from engine is clear of discoloration. Close drains and refill the engine with recommended coolant mixture.

4. Use 50% water / 50% ethylene glycol antifreeze mix. Antifreeze mixture is recommended as a good year-round coolant.

5. Check hoses and connections and repair any leakage.

6. Start the engine and check for leaks. Run the engine for five minutes, then shut it down. Let engine cool, and then check the coolant level in the engine. Add coolant as needed.

NOTE: Be sure to open the sea-cock after working on the engine cooling system and starting the engine.
SP16. HEAT EXCHANGER

1. Clean the heat exchanger core once a year or after 2400 hours of operation.

2. Drain the expansion tank and heat exchanger.

3. Remove the heat exchanger end covers.

4. Clean the inside of the exchanger core tubes using a metal rod. Flush, inspect, and clean again if necessary.

5. Reassemble the heat exchanger. Fill the cooling system. Start the engine and check for leaks.

SP17. RAW WATER PUMP

1. Change the raw water pump impeller every 600 hours, or as needed.

2. Remove the pump cover. Pry out the impeller using needle-nose pliers or two screwdrivers. Be sure to remove all pieces of the failed impeller.

NOTE: Place some kind of protection under the screwdrivers in order to not damage the pump housing.

3. Clean the inside of the housing.

4. Press in the new impeller and place the sealing plug in the outer end of the impeller center if this has not already been done.

NOTE: Make sure that there is always an extra impeller and cover gasket in reserve on board.

SP18. ZINC ELECTRODES

1. A zinc electrode is installed in the heat exchanger cooling system to protect the engine from electrolysis. Check it faithfully every 200 hours. If you are in warm saltwater, or where electrolysis is a known problem, check it more often.

2. Remove the zinc holder from the bottom of the exchanger (Figure 2-11). This will drain raw water from the exchanger.

3. Scrape or steel brush the zinc electrode clean. If more than 50% of the electrode is corroded away, replace it with a new zinc. The electrode screws out of the holder.

4. Reinstall the zinc holders. Be sure the threads are clean for good metal-to-metal contact. Do not use thread sealant.

5. Refill the cooling system. Start the engine and check for leaks.

PTO

There are no servicing requirements for the Optional PTO with electric clutch.

Figure 15: Optional PTO with electric clutch
Servicing

GENERATOR END

The maintenance and operation recommendations for the generator end are in a separate Owner’s Manual. If you do not have one of these manuals, contact your local dealer.

ELECTRICAL SYSTEM - GENERAL

1. Never switch the battery switch off or break the circuit between the alternator and the batteries while the engine is running. Alternator damage can result.

2. Do not reverse the polarity of the battery cables when installing the battery.

BOOSTER BATTERIES

CAUTION: Battery gas can explode. Keep all flames and sparks away from batteries.

1. Before changing or using booster batteries, check the battery electrolyte level. Add distilled water if necessary.

2. Booster and main batteries must have the same voltage rating.

3. First, connect the positive (+) terminal of the booster battery to the positive (+) terminal of the main battery. Then, connect the negative (−) terminal of the booster battery to ground on the engine block (Figure 16).

4. Remove the booster battery after starting the engine.

5. Sealed Batteries:
   See the manufacturer’s charging and booster instructions.

![Diagram of Battery Connections]

Figure 16: Booster Battery Connections
SP19-20. BATTERY CARE

1. Check the electrolyte level every 50 hours, or once a month. Add distilled water to the manufacturer's recommended level.

2. Batteries, cables, and cable terminals should be checked and cleaned every 100 hours. Clean corrosion with a water and baking soda solution. Flush with clean water. Tighten terminals and grease them to inhibit future corrosion.

3. Check the battery condition with a hydrometer every 600 hours.

SP23. WINTERIZING / OUT-OF-SERVICE

NOTE: Remember to close the sea-cock before opening drain cocks.

1. Change the crankcase oil and filter.

2. Drain fresh water and seawater cooling systems completely. Flush fresh water systems and refill with the proper antifreeze mixture.

3. Drain the water supply lines and wet exhaust line.

4. Loosen the seawater pump cover and drain the pump.

5. Loosen the alternator belt.

6. Disconnect and clean the battery. Remove the battery to a warm storage place if possible.

7. Clean the outside of the unit. Paint any scratched or chipped surfaces. Put corrosion preventative on all exposed metal surfaces.

### Electrical

| Minimum Battery Capacity | 220 Amp/hour - 640 CCA | 220 Amp/hour - 640 CCA |
| Instrument Harness Length | 20 ft (6.1 m) | 20 ft (6.1 m) |
| Starting Voltage, Negative Ground | 12 VDC | 12 VDC |

### Air

| Generator Cooling Air Flow | 588 cfm (16.6 m³/m) | 490 cfm (13.9 m³/m) |
| Air Consumption | 74 cfm (2.1 m³/m) | 62 cfm (1.75 m³/m) |
| Maximum Engine Room Vent | 39 sq in (193 cm²) | 39 sq in (193 cm²) |
| Maximum Exhaust Back Pressure | 48 in H₂O (122 cm H₂O) | 48 in H₂O (122 cm H₂O) |
| Wet Exhaust Elbow OD | 3 in (75 mm) | 3 in (75 mm) |

### Fuel

| Minimum Suction Line | 3/8 in (10 mm) | 3/8 in (10 mm) |
| Minimum Return Line | 3/8 in (10 mm) | 3/8 in (10 mm) |
| Maximum Fuel Pump Head | 39 in (1 m) | 39 in (1 m) |
| Specific Fuel Consumption at Maximum Load | 0.360 lbs/hp/hr (222 g/kw/hr) | 0.360 lbs/hp/hr (222 g/kw/hr) |
| Approximate Fuel Rate at Maximum Load | 2.3 gal/h (8.7 ltr/hr) | 1.8 gal/h (6.8 ltr/hr) |

*NOTE: Specifications are subject to change without notice.*

NOTES:
1. ALL INSTALLATION WIRING IS #14 AWG
   TYPE MTW 105 C MULTISTRAND CONDUCTORS.
2. FOR REMOTE VOLTAGE ADJUST RheostAT CUT JUMPER
   AND SPLICE INTO PURPLE LEADS.
3. SET FOR CURRENT APPLICATION (50 OR 60 Hz).
